Modifying your profile (.profile or .bash_profile)

All the following should be done in your startup profile.

(1) Use https://gist.github.com/stephenll/8762279 (or the UnixLab2.5_bash_profile.txt file) as a guide to add **5 different cool aliases** to your startup profile.
(2) Change your prompt (PS1) so that it includes the date and time.
(3) Make a new directory in your home directory called MY_EXECUTABLES and add it to your path in your profile.
(4) Add the extract command from the example .bash_profile on github (lines 126-149), then use.
    a. Make a tar archive of a small directory. Put a few files in it first and then gzip the file. (You may already have one.)
    b. Move it into a temporary directory (TMP)
    c. Use the new 'extract' command to extract the tarball.

(5) Try adding one of the search aliases (find command)
